# How to Compare Distributions

When you compare two or more data sets, focus on four features:

- \* **Center.** Graphically, the center of a distribution is the point where about half of the observations are on either side.
- \* **Spread**. The spread of a distribution refers to the variability of the data. If the observations cover a wide range, the spread is larger. If the observations are clustered around a single value, the spread is smaller.
- \* Shape. The shape of a distribution is described by symmetry, skewness, number of peaks, etc.
- Unusual features. Unusual features refer to gaps (areas of the distribution where there are no observations) and outliers.

#### SPREAD

The spread of a distribution refers to the variability of the data. If the data cluster around a single central value, the spread is smaller. The further the observations fall from the center, the greater the spread or variability of the set.

More Spread

## SHAPE

The shape of a distribution is described by symmetry, number of peaks, direction of skew, or uniformity

## **UNUSUAL FEATURES**

Sometimes, statisticians refer to unusual features in a set of data. The two most common unusual features are gaps and outliers.

## Practice Problems:

What shape would the following situations have?

- 1) A really hard test
- 2) A really easy test
- 3) Results of rolling a 6 sided die 1000 times
- 4) Heights of female students at Sprayberry
- 5) Combined heights of male and female students at Sprayberry
